The difference point between Current Transformer and Hall effect Current Sensor

電流測定のための間接測定方法としては電流磁気効果型と電子誘導型に区分されます。

電子誘導型は電磁界の誘導現象を利用したもので、交流電流測定には有利だが、非整形波及び直流電流波形の測定には別途の周辺回路を含まなくては測定に困難が多いのが短所です。

また周波数備え出力信号の非線形性や過電流時に現われる破壊現象も CTの使用に困難を現わす現象たちです。

しかし、電流磁気効果型の電流センサーは上記の CTが持つ問題点を解決したのが長所です。それはホール効果理論を利用した磁-電変換素子(ホール素子)と磁性材料、これらを組み合わせた電子回路が一体化されて電流センサー(電流検出器)で構成されます。

ですから製品の小型化が可能で、測定電流電源と完全に絶縁された状態で非常に優秀な線形性を持って(0.1% ~ 1.0%)、過電流時にも非破壊特徴と優秀な温度特性を維持し、なおかつ CTができない直流電流波形や非整形交流電流波形の測定に全然問題がない、全ての範囲の測定が可能であるのが特徴です。

The ways of indirect measurement are divided electromagnetic induction and galvano-magnetic effect for current measurement.

The electromagnetic induction utilizes electronic induction phenomenon in electronic system.

But electromagnetic induction isn't available to measure atypical Wave forms and current DC without extra additional factors except AC current. In addition, frequency contrast output character is different in AC current waveforms and destructive phenomenon appears more than rated current condition.

Nevertheless galvano-magnetic effect changes all weak points of electromagnetic induction to advantage.

Electrical (Ha~ effect) Current Sensor uses the above galvano-magnetic effect. And then Current Sensor consists of hall element and magnetic material and electric circuit unifying these.

These facts represent that magnetic material, hall element and saturation region maintains very excellent straight linear type (0.1 % ~ 1.0%) and don't differentiate between AC current wave and DC current wave.

Open loop & Closed loop - Type - Current Sensor Feature

Open loop current Sensorは開放型回路で構成されて、測定電流備え出力信号が電圧信号として出力される特徴があります。これはセンサー内部の演算増幅器を通じて測定電流と等しい形象と比例値の信号で出力されるので、使用者が電流センサーと共通電源を通じて受信回路のA/D変換器や演算増幅器及び制御回路の入力端に、特別な構成を添加しないで手軽に連結することができる長所があります。

Open loop current Sensor is consists of open circuit so output appears measurement current contrast output voltage. Power resource voltage supplied to sensor appears output voltage, As this output voltage is shown as power resource voltage supplied in sensor, the same appearance with measurement current and potential value through the operational amplifier inside sensor, it has advantage of connecting easily AID converter and control circuit board of though common power resource or input of operational circuit.

Zero Flux 概念で構成された電流検出器です。これは磁性体の磁束密度が常に '0' 状態を維持させる方法で測定電流の流れと反対の出力信号 ($x N \text{ Turn}$)の電流を逆に流すことで可能になります。ですから磁性体の特性に寄り掛からない結果、より高い周波数帯域幅と応答度、磁性体の温度変化特性を著しく改善させる長所があります。

This type is the current sensor with zero flux conception. "Zero Flux concept" means that keeping magnetic flux density of magnetic body '0' condition, In other word& this type of current sensor make it possible by sending the output signal of current ($X N \text{ Turn}$) to the reverse direction of measuring current.

Open loop & Closed loop - Type - Voltage Sensor Feature

電圧検出器の原理は既存の電流検出器を基本として、次の図面のように測定電圧から抵抗 R を通過した電流が $x N \text{ Turn}$ の割合で巻いている電圧測定用コイルを通過する時に電流検出器が電流の量として読み込む方法です。ところで抵抗を通過する電流の形象は電圧と等しいので、電流センサーの出力信号をそのまま電圧信号として活用したのが電圧検出器の原理です。

The main principle of voltage sensor is that current sensor can read the current passed resistance "R" and current measuring coils(coiled at $x N \text{ Turn}$ rate) as amount of current. In other words, the output signal of current sensor is considered as voltage signal because the signal of current passed resistance "R" is same as voltage.
